

Problem Statement

Project Title: AI Based Trek Planner

Planning a trekking trip requires researching suitable routes, estimating costs, preparing itineraries, assessing fitness, and creating packing checklists. Existing resources are scattered across websites and blogs, making planning time-consuming and confusing, especially for beginners. Many users also lack personalized guidance based on their fitness level, experience, preferred region, season, budget, and group size.

The objective of the **AI Based Trek Planner** project is to develop an intelligent web application that simplifies trek planning by providing AI-powered trek recommendations, day-wise itineraries, personalized packing checklists, fitness assessments, and essential safety guidance. The system aims to deliver customized recommendations and planning assistance through a conversational AI interface, reducing manual effort while helping users make informed and safer trekking decisions. The application focuses on improving convenience, personalization, and accessibility for trekking enthusiasts while emphasizing that final travel decisions should always be verified with official advisories and local conditions.
